

The Good

we had a productive design jam

No last minute release patches this time!

We communicated well amongst our teams

Underestimated by only about 25%

Good PR comments and reviews by majority

The Bad

Wanted to integrate data stuff without the data layer being designed or built

ESLint was sometime differing in CI and locally

Playwright said that we were SOL for using their tools

Drei didnt get fixed

we need more eyes on prs

although it is possible to use automated testing on pictures using different image processing techniques. This really only will allow our automated testing to go so far

Shared risk document wasn't used. Which is fine if no one has any risks to add.

"Matt forgot to write about patching procedures" ~ Matt

Other

Walk through of the data abstraction diagram would be good so everyone knows the goal

Our personal capacities were poorly estimated

Questions

Have we figured out the ambiguity with what they want for PCA?

Yes. Basically ignore the example and just do a PCA.

sweet

Can we pull testers into reviewing PR?

Did Dr. Osgood ever get back to us about having an extra dev member (switching a tester to a dev)?

Yes not happening
