

The Good

Trang shadowing Matt

No one get hit by a bus

A lot of knowledge sharing, you guys are goated

Zander gave a very helpful run-down of git action workflow

Jesse and Mitchell got the spikes done!!

Dev/ test team leads will be staying where they are for an easier transition to next ID

The Bad

PRs and Reviews

There are too many platforms to keep track of Discord, Mail and Github. We should use Discord for most communication, Github for PR and minimal email usage

TypeScript syntax

PR comments got overlooked

No Time Tracking/Estimation

Specifications of what to submit/to be done for deliverable are vague/confusing

Other

Need new design lead

If you drop the class, I will track you down and be under your bed <3

Need to decide on a standard IDE. give the # of .idea files, I'm guessing most people are using WebStorm

Since lots of new people to TS/ react. How can we establish requirements for how the code needs to look early so we dont need to fix it later

Need to establish a form of communication for the QA team to start testing early for new features so they are not last minute

I dont now what to put for a sticky note, but these all look great

Questions

How do we organize the project's file structures? Currently have all the code under root/src/components and test under root/tests.

should the tester also write unit test? Reduced dead time wait for dev and improve QA

I am not sure how to write unit test =((((

How do we switch dev/test team?

When should we delete branches that already got merged?

if we add gherkin files how do we want to merge them in???

How can the dev team make it testable for the test team? can we have extra buttons for test environment?

Make dev lead also design lead?

Walkthrough on pull requests
